

[Chinese Version](README.md)

##背景

在加载图片，执行 kmd 时，需要对代码输入输出功能和寄存器功能进行调试

##下载

Download from [https://gitee.com/yds90/git\\_test.git](https://gitee.com/yds90/git_test.git)

```
```bash
git clone https://gitee.com/yds90/git_test.git
````
```

## 输入输出内存功能使用

#fpga 上运行

```
```bash
Usage: ./nvdla_runtime [-options] --loadable <loadable_file>
where options include:
```

-h	print this help message
-s	launch test in server mode
--image <file>	input jpg/pgm file
--normalize <value>	normalize value for input image
--mean <value>	comma separated mean value for input image
--rawdump	

```
````
```

```
```bash
insmod drvtest.ko
insmod opendla.ko
./nvdla_runtime --loadable mnist_32x8x8.nvdla --image 9.jpg
````
```

>说明： --loadable 和--image 后面可替换成其它 loadable 文件和图片。

#echo 命令读取数据

```
```bash
cd /sys/class/mytest_class/mytest_device
```

>若输入"RM "或"WM "，则命令如下：

```
echo "RM start_addr,size" > my_device_test
```

或 echo "WM start\_addr,size" > my\_device\_test

```
#define path "/home/root/flw_kmd_test/weight_mnist_data.bin"  
```bash
```

>说明： input、output、weight 数据写入文件的路径。

```

#运行截图

正确输入：echo "RM 0x40100000,0x1880" > my\_device\_test

正确运行如下，运行完成会生成二进制文件：weight\_data.bin。

```
337.474701] enter write_data  
337.477585] cut_buf=R  
337.479847] cut_buf=M

```

## 寄存器功能使用

```
```bash
cd /sys/class/mytest_class/mytest_device
```

>若输入"IO "，则命令如下：

```
echo "IO start_addr,end_addr" > my_device_tes
```

```

>说明： 目前只能输入一个 start\_addr 地址或者一段地址，可以打印出对应的寄存器数据

#运行截图

正确输入： echo "IO 0x3030,0x3098" > my\_device\_test

正确运行如下， 打印一段寄存器数值。

```
[ 255.612361] start_addr=0x3030 io_buf=IO 0x3030,0x3098
[ 255.618977] start_addr : 0x3030
[ 255.622116] READ reg_info : 0x0
[ 255.625335] start_addr : 0x3034
[ 255.628472] READ reg_info : 0x4000d000
[ 255.632304] start_addr : 0x3038
[ 255.635437] READ reg_info : 0x0
[ 255.638657] start_addr : 0x303c
[ 255.641791] READ reg_info : 0x4000d000
[ 255.645619] start_addr : 0x3040
[ 255.648747] READ reg_info : 0x8
[ 255.651973] start_addr : 0x3044
[ 255.655107] READ reg_info : 0x0
[ 255.658329] start_addr : 0x3048
[ 255.661456] READ reg_info : 0x8
[ 255.664675] start_addr : 0x304c
[ 255.667811] READ reg_info : 0x10001
[ 255.671377] start_addr : 0x3050
[ 255.674509] READ reg_info : 0x0
[ 255.677730] start_addr : 0x3054
```

错误输入：echo "IO 0x40100000,0x1880" > my\_device\_test

运行得到错误结果：

```
[ 220.685234] enter write_data
